Try Below Questions with Python Codes

- You may use variables as required
- If you have any special assumptions, mention it under comments
- Take a look at the sample images to see sample output
- Use most suitable Python techniques as required

---

1. Create a program which will accept user insert end value (say 4 or 11 or 25). The program should display the values from 0 to user insert values. Use loops. However, the loop should stop when the iterating value becomes 15 (15 is not displayed).

```
Type end value : 13
0 1 2 3 4 5 6 7 8 9 10 11 12 13
>>>
```

```
Type end value : 17
0 1 2 3 4 5 6 7 8 9 10 11 12 13 14
>>>
```

2. Create a program which will accept user input start and end value. The program should display values from starting to end but must skip values with 5x times! Two sample output are given below.

```
Type start value : 9
Type end value : 22
9 11 12 13 14 16 17 18 19 21 22
>>>
```

3. Create a program to do the following. Type your last name.
    a. Display the number of characters in your last name.
    b. Display the 3rd character of your surname
    c. Display your name in all capital letters
    d. Display your name in all simple letters
    e. Display last 3 letters of your surname

```
Type surname : Harankahawa
Length of your surname : 11
3rd Letter of your surname : r
Full capital : HARANKAHAWA
Full simple : harankahawa
Last 3 characters 'awa'
>>>
```

```
Type surname : Silva
Length of your surname : 5
3rd Letter of your surname : l
Full capital : SILVA
Full simple : silva
Last 3 characters 'lva'
>>>
```

4. Create a program which can accept any integer and convert the given number to its binary, octal and hexadecimal format.

```
Type an integer : 5
You typed : 5
Binary format is : 0b101
Octal format is : 0o5
Hex format is : 0x5
>>>
```

```
Type an integer : 77
You typed : 77
Binary format is : 0b1001101
Octal format is : 0o115
Hex format is : 0x4d
>>>
```

5. Can you modify the above program to display the answers without the special prefixes? So the values will be displayed without 0b, 0o or 0x.

```
Type an integer : 77
You typed : 77
Binary format is : 1001101
Octal format is : 115
Hex format is : 4d
>>>
```

6. Create a program which can accept any letter (A to Z or a to z) and display its ASCCI value to user.

```
Type a letter : a
ASCII value is : 97
>>>
```

```
Type a letter : B
ASCII value is : 66
>>>
```

7. Create a python program which can do the following
    a. Get 5 customer details to a list (user will insert the values)
    b. Update the 4th customer name to “Seth”
    c. Display the length of the name of the last customer
    d. Convert the customer list to a tuple
    e. Display the length of the tuple
    f. Display all the customer names using the tuple (use a loop)
    g. Delete the newly created tuple

A sample output is attached to this question for you to have a look!

```
Insert Customer 1 : Jagath
Insert Customer 2 : Anuradha
Insert Customer 3 : Samanmali
Insert Customer 4 : Judi
Insert Customer 5 : Ahamed
['Jagath', 'Anuradha', 'Samanmali', 'Judi', 'Ahamed']
New 4th Customer : Seth
Length of last name : 6
Length of tuple : 5
Jagath
Anuradha
Samanmali
Seth
Ahamed
