Simple Calculator Version

Design a Python program to develop the below shown calculator.

- You must enter operands and the operator
- Your program should be able to do below calculations
    - Addition of two user input numbers
    - Subtraction of two user input numbers
    - Multiplication of two user input numbers
    - Division of two user input numbers
    - Find the power of a number based on user input base and power value
- Each calculation must be done by a separate function which will accept parameters and return values.

Trask 1

- Create an algorithm for above task (use pseudocodes)
- Write the program in Python language

Task 2

- If Task 1 is completed, do the actual coding in computer to see the result.
