Try Below Questions with Python Code

1. Manually create a new text file with below data. Write a Python code to display the content of the file.

WWW is the term stands for World Wide Web. This is used by many educators while explaining the Internet. Some internet website address even starts with this www term!

2. Create a program to read the above file and display how many lines of text are available in the above file.
    a. Answer must be 3
3. Manually create a new text file with below data. Scan through the file and display only even numbers in the console. (All values are 2 digit numbers with a trailing space).

45 68 59 62 65 47 52 10 12 02 25 56 23 54 58 59 56 52 54 56 52

4. Create another program which will read the above file and write only odd numbers to a new text file called **Odd.txt**. There will be no console output.
    a. You have to check the Odd.txt file via **notepad** to read the information.
5. Create a Python program which can read a text file and convert all the simple letters of it to capital letters. Your program should save the capitalized text to the same file.
    a. You may create a dummy text file as below

(Before)

this is a file where I have all simple text. let's see whether I can do this or not!

(After)

THIS IS A FILE WHERE I HAVE ALL SIMPLE TEXT. LET'S SEE WHETHER I CAN DO THIS OR NOT!
