Create a Python program which can define a matrix when a user insert the dimensions. The program must be able to,

1. Read matrix dimension values from user (user will type values such as 2x3 or 4x5, etc.)
2. Read matrix values from the user (each value separately)
3. Display the matrix values (break the output based on rows and columns of the given dimension)
4. Multiply the values of the matrix based on a user input value and display the new matrix

Some sample output screens

```
Type matrix size (2x2 to 9x9 only) : 2x3

Value for (1,1) : 2
Value for (1,2) : 3
Value for (1,3) : 4

Value for (2,1) : 2
Value for (2,2) : 1
Value for (2,3) : 3

Matrix size :  2x3

2  3  4
2  1  3

Type a value to multiply the matrix : 2

Matrix size :  2x3

4  6  8
4  2  6
>>>
```

```
Type matrix size (2x2 to 9x9 only) : 4x3

Value for (1,1) : 10
Value for (1,2) : 15
Value for (1,3) : 20

Value for (2,1) : 30
Value for (2,2) : 44
Value for (2,3) : 35

Value for (3,1) : 22
Value for (3,2) : 15
Value for (3,3) : 10

Value for (4,1) : 33
Value for (4,2) : 45
Value for (4,3) : 44

Matrix size :  4x3

10  15  20
30  44  35
22  15  10
33  45  44

Type a value to multiply the matrix : 2

Matrix size :  4x3

20  30  40
60  88  70
44  30  20
66  90  88
>>>
```

Main Task 1

Draw a diagram which will show the packages, modules and the functions used you have used. You can use lines to display how the functions calls are taking place. Use an A4 sheet for this.

Main Task 2

Implement the program using proper Python 3.x codes and with the help of packages and modules.

Challenge Task

Update the program as a console program so the users can run this program by typing matrix dimension from the command console.

```
C:\Users\Nishan>py mcalc.py 2x3

C:\Users\Nishan>mcalc 2x3
```
