Try Below Questions with Python Codes

1. These questions were already completed by you
2. Now you have to re-do them by adding database functionalities
3. If you have any special assumptions, mention it as a comment in your programs
4. Use most suitable Python techniques and language constructs as required

---

1. Create a Python program to read 5 student names and 5 subject marks. The program should output all the marks user inserted with student names and a 10 star rating based on his/her marks.
    a. Once the information is displayed, they must be written to a database. You can decide the table structures and the content you prefer to keep.
    b. Create a second program which will allow you to display the below information
        i. All past students records
        ii. All past marks records
    c. Use suitable Python language constructs to complete the program (packages, modules, functions, etc.)

Two sample output screens are given below for your reference. Pay attention to these to complete the program.

```
Type student name : Dulith
Type student mark : 56
Type student name : Arjuna
Type student mark : 88
Type student name : Nalaka
Type student mark : 65
Type student name : Shani
Type student mark : 23
Type student name : Pooja
Type student mark : 45
Dulith    :  56 % >>  *****
Arjuna    :  88 % >>  ********
Nalaka    :  65 % >>  ******
Shani     :  23 % >>  **
Pooja     :  45 % >>  ****
Total marks of the whole class : 277
Average marks of the whole class : 55.4
>>>
```

```
Rec No  Stu 1   Stu 2   Stu 3   Stu 4   Stu 5
=============================================
8690    Kushan  Nishan  Sumith  Fazil   Janaki
3471    Dulith  Arjuna  Nalaka  Shani   Pooja

Rec No  Mrk 1   Mrk 2   Mrk 3   Mrk 4   Mrk 5
=============================================
8690    50      75      68      95      45
3471    56      88      65      23      45
>>>
```

2. This question is based on the console based lotter program you did early.
    a. Re-create the lottery program to have the database functionalities (you may need to modify the original codes)
    b. Users must be able to play the lottery program any number of times. Every draw detail will go in to a database of your own design.
    c. A separate program will allow the users to do below things.
        i. Display all the past lottery details (draw number, lottery numbers, etc.)
        ii. Display a specific result of a given draw number

```
Insert number 1 : 5
Insert number 2 : 6
Insert number 3 : 9
Insert number 4 : 2
Insert number 5 : 1
User numbers :  5 6 9 2 1
Lott numbers :  4 2 3 4 3
You have 0 matches
>>>
```

Figure 1 : Your Original Program

Below are sample screens from an actual website called NLB https://www.nlb.lk/, which provides these type of services.

- Please note below screens are given for you to get an idea of a real product. Your program is a console program, not a Python based webpage!

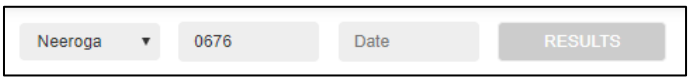

Figure 2 : Search via draw number

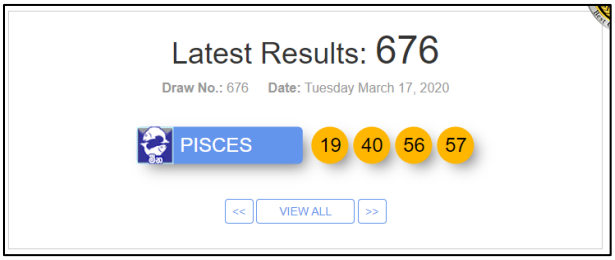

Figure 3 : Display specific draw number details

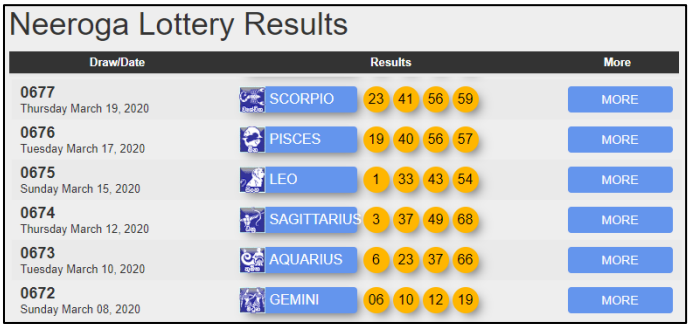

Figure 4 : All past records
