Try Below Questions with Python Codes

1. Use the knowledge of Bubble sort to complete these programs
2. If you have any special assumptions, mention it as a comment in your programs
3. Use most suitable Python techniques and language constructs as required
4. Make sure you create the sample files (text and csv) for all 3 programs shown below

---

1. Create a program to read a text file and sort the numbers. Use bubble sort algorithm. The sorting should happen in ascending order. Make sure to use proper functions.
    a. A sample text file should have below data

    45 26 56 58 54 57 58 59 55 65 25 55 54 56 54 55 21 23 25 38 67

2. Create a program to read CSV file and sort the numbers in descending order. Use the bubble sort algorithm. Use functions.
    a. A sample CSV file should have below data

    12,65,45,78,95,68,66,45,58,52,36,65,65,12,21,25

3. Create a program to read a CSV file and sort the numbers. The user needs to key in the CSV file and the option for ascending and descending as a command console argument. Use proper functions.
    a. A sample CSV file should have below data

    12,125,45,65,2,547,589,56,98,54,745,2546,21,25,658

    b. A sample command will be
        i. `C:\>mysort file.csv asc`
        ii. `C:\>mysort data.csv dsc`
    c. `asc` stand for ascending while `dsc` stand for descending
